

Wild Flower Plants for the conservationist from native seed.

Tips for growing your own wild flower meadows, however small or large an area. We have sown several wild flower meadows in different environs we would suggest you take into account the following

1. Research your own specific area by contacting your local Wild Life Trust and asking them which wild flower plants would be native to your soil and area. This way you have a better chance of getting the plants established, as they will be indigenous to the area and should flourish.

2. If you are planting for the first time, it is better to plant a group of established plants, together with the flower seed, as the seedlings take a while to clump up, **we do not use any grass seed at all**, as the grass will come, this way you will be giving the new seedlings a chance of getting established before the grass tries to take over.

3. It is very pleasing to the eye to see the same plant 'on masse' planted in a swathe. Work out the areas & colour combinations and map it out with silver sand before sowing, overlapping the plant seeds to give a more natural effect.

4. Take a look at our huge herb section, as there are many herbs that are native and look charming in the wild flower area their fragrance seems to attract more wild life.

Should you need any more advice regarding your wild flower patch or meadow, please feel free to call us on 01962 771895. Or go to Digging Deep [Wild flower advice](#) now.
